Kingsman Resources Inc. commences drilling at Snowshoe

December 13, 2006

Kingsman Resources Inc. has begun a winter diamond drill program on the company's Snowshoe property. Drilling will test electromagnetic and magnetic anomalies resulting from last year's helicopter-borne survey by Aeroquest Ltd. Several AeroTEM II conductors were identified by the Aeroquest survey. All of these conductors are new targets in unexplored parts of the property with minimal or no outcrop. One of the anomalies is situated only one kilometre west of the Phoenix open pit mine, from which over one million ounces of gold and 540 million pounds of copper were historically produced. A second AeroTEM II anomaly is located 2.1 km west of the Phoenix pit. Both of the conductors exceed 200 metres in strike length and trend northward, parallel to the trend of the Phoenix orebody. Both these targets will be drill tested. Several other electromagnetic anomalies in the southern part of the property will also be drilled.
